Extrusion is a continuous process of converting a solid plastic mass, pellet or powder into a melted form where it is pushed through a die into a shape. In the plastics extrusion process, raw thermoplastic material, or resin, barrel and lowers the risk of overheating which may cause degradation in the polymer. In a single-screw extruder, melting occurs primarily as a result of viscous dissipation (or shearing) of the polymer. Unmelted polymer gets dragged against the. This chapter is intended to provide an overall physical understanding of the single-screw extrusion operation, including the relevant polymer. EXTRUSION. Extrusion is used for processing most types of thermoplastics and rubbers. The extrusion process is a simple process in which molten polymer is.
