

This volume is a report of the symposium on cell growth and division in bacterial, plant, and animal systems. Both the biochemical and the cytological aspects of the subject matter are well treated. This report points out the problems which are currently receiving the most attention and the experimental approaches which are being developed. It is hoped that his work will stimulate further research in the field. The symposium was held May 19-24, 1962, at the Institute of Histology in Liege: the Society is much indebted to Professor M. Chevremont who undertook all the local organization.

Cell Growth and Division publishes insights into cell growth and proliferation to understand the underlying mechanism and the interactions with development. Cells are the smallest autonomous units of life and occupy the midpoint. In short, cell biology has become an integrative hub of much of modern biological research. cytoskeletal dynamics and cell migration, gene expression or cell division can no longer be understood without the Hufnagel Group, Dynamics of cell growth and tissue architecture. Cell Stem Cell publishes peer-reviewed articles reporting findings of unusual stem cell research, including biological advances and ethical and social analysis.
